Notice

Use of the technologies described in this specification may infringe patents, copyrights or other intellectual property rights of FIPA Members and non-members. Nothing in this specification should be construed as granting permission to use any of the technologies described. Anyone planning to make use of technology covered by the intellectual property rights of others should first obtain permission from the holder(s) of the rights. FIPA strongly encourages anyone implementing any part of this specification to determine first whether part(s) sought to be implemented are covered by the intellectual property of others, and, if so, to obtain appropriate licenses or other permission from the holder(s) of such intellectual property prior to implementation. This specification is subject to change without notice. Neither FIPA nor any of its Members accept any responsibility whatsoever for damages or liability, direct or consequential, which may result from the use of this specification.

22 Foreword

23 The Foundation for Intelligent Physical Agents (FIPA) is an international organization that is dedicated to promoting the
24 industry of intelligent agents by openly developing specifications supporting interoperability among agents and agent-
25 based applications. This occurs through open collaboration among its member organizations, which are companies
26 and universities that are active in the field of agents. FIPA makes the results of its activities available to all interested
27 parties and intends to contribute its results to the appropriate formal standards bodies [where appropriate](#).

28 The members of FIPA are individually and collectively committed to open competition in the development of agent-
29 based applications, services and equipment. Membership in FIPA is open to any corporation and individual firm,
30 partnership, governmental body or international organization without restriction. In particular, members are not bound
31 to implement or use specific agent-based standards, recommendations and FIPA specifications by virtue of their
32 participation in FIPA.

33 The FIPA specifications are developed through direct involvement of the FIPA membership. The status of a
34 specification can be either Preliminary, Experimental, Standard, Deprecated or Obsolete. More detail about the
35 process of specification may be found in the FIPA [Document Policy \[f-out-00000\]](#) and the FIPA [Specifications Policy \[f-
36 out-00003\]](#)~~Procedures for Technical Work~~. A complete overview of the FIPA specifications and their current status may
37 be found ~~in the FIPA List of Specifications. A list of terms and abbreviations used in the FIPA specifications may be
38 found in the FIPA Glossary on the FIPA Web site.~~

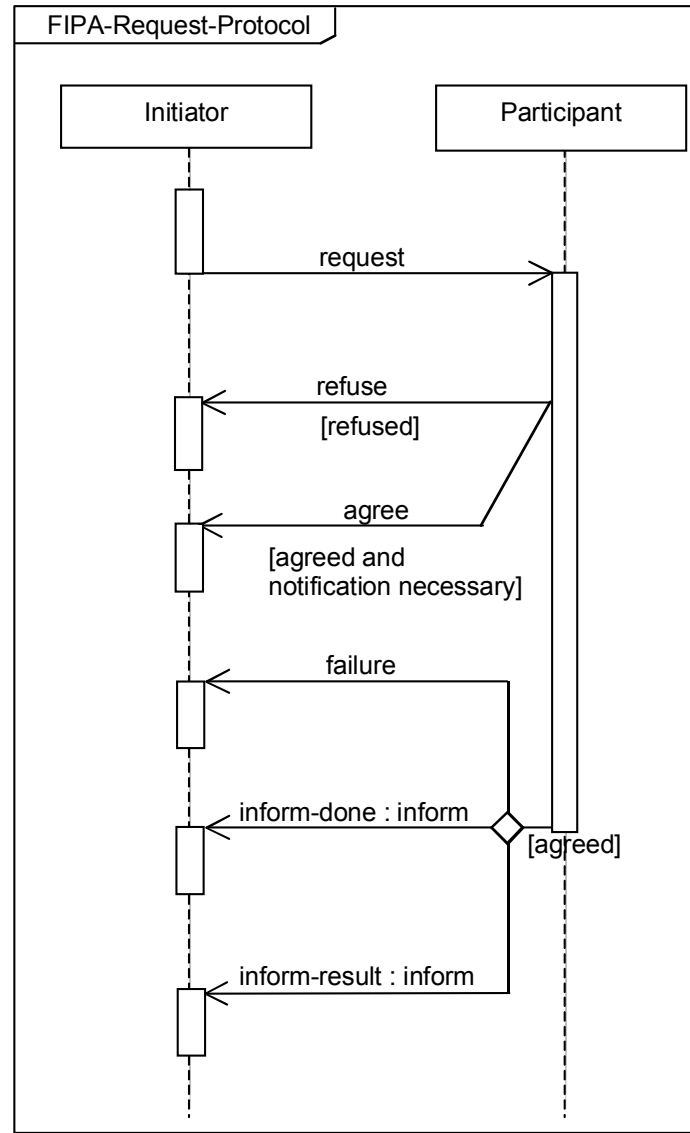

39 FIPA is a non-profit association registered in Geneva, Switzerland. As of ~~June 2002~~[January 2000](#), the 56 members of
40 FIPA represented ~~47~~[many](#) countries worldwide. Further information about FIPA as an organization, membership
41 information, FIPA specifications and upcoming meetings may be found [on the FIPA Web site](#) at <http://www.fipa.org/>.

52 **1 FIPA Request Interaction Protocol**

53 The FIPA Request Interaction Protocol (IP) simply allows one agent to request another to perform some action, ~~and~~
 54 ~~the receiving agent to perform the action or reply, in some way, that it cannot.~~ The representation of this protocol is
 55 given in *Figure 1* which is based on extensions to UML 1.x.AUML [Odell2001]. This protocol is identified by the token
 56 fipa-request as the value of the protocol parameter of the ACL message.
 57

58
 59
 60 **Figure 1: FIPA Request Interaction Protocol**
 61

62 **1.1 Explanation of the Protocol Flow**

63 The FIPA Request Interaction Protocol (IP) allows one agent to request another to perform some action. The
 64 Participant processes the request and makes a decision whether to accept or refuse the request. If a refuse
 65 decision is made, then "refused" becomes true and the Participant communicates a refuse. Otherwise, "agreed"
 66 becomes true. If conditions indicate that an explicit agreement is required (i.e., "notification necessary" is true), then the
 67 Participant communicates an agree. The agree may be optional depending on circumstances, e.g., if the requested
 68 action is very quick, and can happen before a :reply-by time from the request is reached. Once the request has
 69 been agreed upon, then the Participant must communicate either (1) a failure if it fails in its attempt to fill the
 70 request; (2) an inform-done if it successfully completes the request and only wishes to indicate that it is done; or (3)

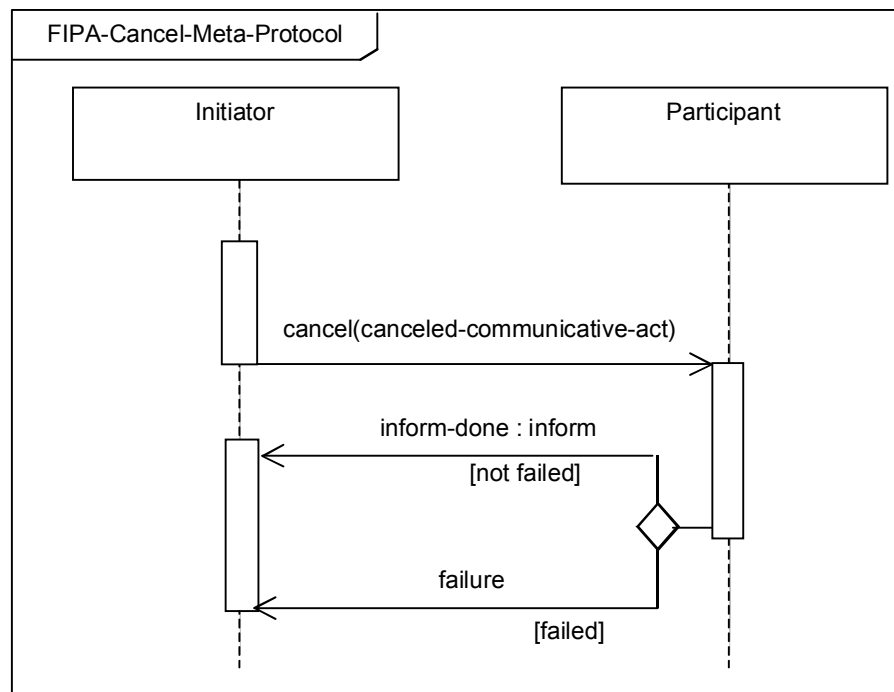

71 an `inform-result` if it wishes to indicate both that it is done and notify the initiator of the results. (A better
 72 explanation here)

73 Any interaction using this interaction protocol is identified by a globally unique, non-null `conversation-id`, assigned
 74 by the Initiator. The agents involved in the interaction must tag all of its ACL messages with this conversation identifier.
 75 This enables each agent to manage its communication strategies and activities, e.g., it allows an agent to identify
 76 individual conversations and to reason across historical records of conversations.
 77

78 **1.2 Exceptions to Protocol Flow**

79 At any point in the IP, the receiver of a communication can inform the sender that it did not understand what was
 80 communicated. This is accomplished by returning a `not-understood` communication. As such, the figure above
 81 does not depict a `not-understood` communication as it can occur after any communication. The communication of a
 82 `not-understood` within an interaction protocol may terminate the entire IP. Termination of the interaction may imply
 83 that any commitments made during the interaction are null and void.
 84

85 At any point in the IP, the initiator of the IP may cancel the interaction protocol by initiating the meta-protocol shown in
 86 Figure 2. The `conversation-id` of the cancel interaction is identical to the `conversation-id` of the interaction that the
 87 Initiator intends to cancel. The semantics of the cancel should roughly be interpreted as meaning that the initiator is no
 88 longer interested in continuing the interaction, and that it should be terminated in a manner acceptable to both the
 89 Initiator and the Participant. The Participant either informs the Initiator that the interaction is done using an `inform-`
 90 `done`, or indicates the failure of the cancellation using a `failure`.
 91

92 Figure 2: FIPA cancel meta-protocol

93
 94
 95 This IP is a pattern for a simple interaction type. Elaboration on this pattern will almost certainly be necessary in order
 96 to specify all cases that might occur in an actual agent interaction. Real world issues such as the effects of cancelling
 97 actions, asynchrony, abnormal or unexpected IP termination, nested IPs, and the like, are explicitly not addressed
 98 here.
 99

100 ~~““”The communication of a `not-understood` within an interaction protocol terminates the IP. Furthermore, tTThis~~
 101 ~~protocol is a pattern for a simple interaction type. Elaboration on this pattern will almost certainly be necessary in order~~
 102 ~~to specify all cases that might occur in an actual agent interaction. Real world issues of cancelling actions, asynchrony,~~
 103 ~~abnormal or unexpected protocol termination, nested protocols, and the like, are explicitly not addressed here.~~

109 **23 Informative Annex A — ChangeLog**

110 **2.13.1 2002/05/10 - version G by FIPA Architecture Board**

- 111 Page 1, Figure 1: The communication labeled «inform-ref» was changed to «inform-result» for clarity. The
112 purpose of this communication is to inform the initiator of a results. Inform-result implies
113 inform-done.
- 114 Page 1, Figure 1 : The «not-understood» communication was removed
- 115 Page 1, Figure 1 : Reworked the protocol flow to make the « agree » optional. This also involved changing the
116 exclusive-or with the agree to a different AUML notation.
- 117 Page 1, Figure 1 : To conform to UML 2, the protocol name was placed in a boundary, « x » is removed from
118 the diamonds (xor is now the default), and the template box was removed.
- 119 Page 1, line 50 : Added a new section 1.1 entitled « Explanation of the Protocol Flow »
- 120 Page 1, line 50 : Renumbered old section 1.1 to section 1.2. Added a paragraph explaining the not-
121 understood communication and its relationship with the IP.
- 122 Page 1, line 42 : Removed some of the explanation, it was superseded by the explanation in Section 1.2.
- 123 Page iii : Regenerated Table of Contents
- 124
