### Notice

Use of the technologies described in this specification may infringe patents, copyrights or other intellectual property rights of FIPA Members and non-members. Nothing in this specification should be construed as granting permission to use any of the technologies described. Anyone planning to make use of technology covered by the intellectual property rights of others should first obtain permission from the holder(s) of the rights. FIPA strongly encourages anyone implementing any part of this specification to determine first whether part(s) sought to be implemented are covered by the intellectual property of others, and, if so, to obtain appropriate licenses or other permission from the holder(s) of such intellectual property prior to implementation. This specification is subject to change without notice. Neither FIPA nor any of its Members accept any responsibility whatsoever for damages or liability, direct or consequential, which may result from the use of this specification.

## 20 **Foreword**

21 The Foundation for Intelligent Physical Agents (FIPA) is an international organization that is dedicated to promoting the  
22 industry of intelligent agents by openly developing specifications supporting interoperability among agents and agent-  
23 based applications. This occurs through open collaboration among its member organizations, which are companies  
24 and universities that are active in the field of agents. FIPA makes the results of its activities available to all interested  
25 parties and intends to contribute its results to the appropriate formal standards bodies where appropriate.

26 The members of FIPA are individually and collectively committed to open competition in the development of agent-  
27 based applications, services and equipment. Membership in FIPA is open to any corporation and individual firm,  
28 partnership, governmental body or international organization without restriction. In particular, members are not bound  
29 to implement or use specific agent-based standards, recommendations and FIPA specifications by virtue of their  
30 participation in FIPA.

31 The FIPA specifications are developed through direct involvement of the FIPA membership. The status of a  
32 specification can be either Preliminary, Experimental, Standard, Deprecated or Obsolete. More detail about the  
33 process of specification may be found in the FIPA Document Policy [f-out-00000] and the FIPA Specifications Policy [f-  
34 out-00003]. A complete overview of the FIPA specifications and their current status may be found on the FIPA Web  
35 site.

37 FIPA is a non-profit association registered in Geneva, Switzerland. As of June 2002, the 56 members of FIPA  
38 represented many countries worldwide. Further information about FIPA as an organization, membership information,  
39 FIPA specifications and upcoming meetings may be found on the FIPA Web site at <http://www.fipa.org/>.

50 **1 Scope**

51 This document is part of the FIPA specifications and deals with message transportation between inter-operating  
52 agents. This document also forms part of the FIPA Agent Management Specification [FIPA00023] and contains  
53 specifications for:

54

- 55 • The transportation of messages between agents using the Internet Inter-Orb Protocol (IIOP - see [OMGiop]).

56

## 56 2 Message Transport Protocol for IIOP

57 This MTP is based on the transfer of an OMG IDL structure containing the message envelope and an octet sequence  
58 representing the ACL message body. The envelope and the message body are transferred together within a single  
59 IIOP one-way invocation [OMGiioip].

60  
61 Once the request has been received, the message envelope is used by the ACC to obtain the instructions and  
62 information needed to correctly handle the message body.  
63

### 64 2.1 Component Name

65 The name assigned to this component is:

66  
67 `fipa.mts.mtp.iiop.std`  
68

### 69 2.2 Interface Definition

70 The following IDL specifies the message transport interface. This interface contains a single operation message() that  
71 requires a single argument. This argument has two attributes: a sequence of Envelope structures holding the message  
72 envelope, and the payload, that is a sequence of octets containing the ACL message body.

```
73
74 module FIPA {
75     typedef sequence<Envelope> Envelopes;
76     typedef sequence<octet> Payload;
77     struct FipaMessage {
78         Envelopes messageEnvelopes;
79         Payload    messageBody;
80     };
81
82     interface MTS {
83         oneway void message(in FipaMessage aFipaMessage);
84     };
85 };
86
```

### 87 2.3 ACC Processing of IDL Envelope

88 According to [FIPA00067], a FIPA compliant ACC is not allowed to modify any element of the envelope that it receives.  
89 It is however allowed to update a value in one of the envelope slots by adding a new Envelope element at the end of  
90 the messageEnvelopes sequence. This new element is required to have only those slot values that the ACC wishes  
91 to add or update plus a new ReceivedObject element as mandated in [FIPA00067].

92  
93 As a consequence, an ACC that receives a message must implement the procedure described in the following  
94 pseudo-code. The procedure recomposes the full envelope structure with its latest values for each slot. The procedure  
95 simply shows that the ACC starts from the last envelope in the sequence and continues until it has all the required  
96 values for each slot of the envelope.

```
97 EnvelopeWithAllFields := new empty Envelope;
98
99
100 while ( (EnvelopeWithAllFields does not contain values for all its fields)
101         OR (all Envelopes in the sequence have been processed) ) {
102     // the ACC gets the next envelope in the sequence starting from the end
103     tempEnvelope = getNextEnvelope;
104     foreach field in an envelope {
105         if ((this field has no value in envelopeWithAllFields)
106             AND (this field has a value in tempEnvelope))
107         then copy the value of this field from tempEnvelope to envelopeWithAllFields
108     }
109 }
```

```

110
111 EnvelopeWithAllFields now contains the latest values for all its fields.
112
113 For example:
114
115 Envelope(0):
116   to = tizio
117   from = caio
118   aclRepresentation = XML
119   received = ...
120
121 Envelope (1):
122   from = caio@molfetta.it
123   received = ...
124
125 Envelope (2) :
126   intended-receiver = tizio@villardora.it
127   received = ...
128
129 EnvelopeWithAllFields:
130   to = tizio                               (from envelope 0)
131   from = caio@molfetta.it                 (from envelope 1)
132   intended-receiver = tizio@villardora.it (from envelope 2)
133   date = 25 May 2000                      (from envelope 0)
134

```

## 135 2.4 Concrete Message Envelope Syntax

136 The Abstract Envelope Syntax from [FIPA00067] maps into a set of OMG IDL structured types, all of which are  
 137 enclosed within the FIPA module.

138  
 139 The following standard convention applies for the identification of optional slots: an empty string and an empty  
 140 sequence identify the non-presence of a slot. In the case of payload-length, that is a number, any negative value can  
 141 be used to identify the non-presence of the slot.

142  
 143 The complete IDL definition is:

```

144
145 module FIPA {
146   // No need for an URL struct, since it's only put in the
147   // message envelope for informational purposes.
148   typedef string URL;
149
150
151   // this generic type is used to represent user-defined, non FIPA-defined,
152   // properties that are added to the message envelope in the form of a
153   // keyword and value pair.
154   struct Property {
155     string keyword;
156     any value;
157   };
158
159   struct AgentID { // Agent Identifier
160     string name;
161     sequence<URL> addresses;
162     sequence<AgentID> resolvers;
163     sequence<Property> userDefinedProperties;
164   };
165
166   typedef sequence<AgentID> AgentIDs; // sequence of Agent Identifiers
167
168   // IDL struct to represent a time stamp.
169   // It is based on the ISO8601 format with extension for millisecond durations.
170   // The value of the typeDesignator must be a valid
171   // AlphaCharacter, i.e. ['a'-'z' , 'A'-'Z'], that identifies the timezone.
172   // ISO8601 reports the mapping between typeDesignator and timezone.

```

```

173 // The typeDesignator for UTC is the character 'Z'.
174 // If the value of typeDesignator is not an AlphaCharacter, it defaults
175 // to the local timezone.
176 struct DateTime {
177     short year; // year (e.g. 2000)
178     short month; // between 1 and 12
179     short day; // between 1 and 31
180     short hour; // between 0 and 23
181     short minutes; // between 0 and 59
182     short seconds; // between 0 and 59
183     short milliseconds; // between 0 and 999
184     char typeDesignator; // see comment above
185 };
186
187 struct ReceivedObject {
188     URL by;
189     URL from;
190     DateTime date;
191     string id;
192     string via;
193 };
194
195 typedef sequence<Property> TransportBehaviourType;
196
197 typedef sequence<AgentID,1> OptAgentID;
198 typedef sequence<DateTime,1> OptDateTime;
199 typedef sequence<TransportBehaviourType,1> OptTransportBehaviourType;
200 typedef sequence<ReceivedObject,1> OptReceivedObject;
201
202 struct Envelope {
203     AgentIDs to;
204     OptAgentID from;
205     string comments;
206     string aclRepresentation;
207     long payloadLength;
208     string payloadEncoding;
209     OptDateTime date;
210     AgentIDs intendedReceiver;
211     OptReceivedObject received;
212     OptTransportBehaviourType transportBehaviour;
213     sequence<Property> userDefinedProperties; // user-defined properties
214 };
215
216 typedef sequence<Envelope> Envelopes;
217
218 typedef sequence<octet> Payload;
219
220 struct FipaMessage {
221     Envelopes messageEnvelopes;
222     Payload messageBody;
223 };
224
225 interface MTS {
226     oneway void message(in FipaMessage aFipaMessage);
227 };
228 };
229
230

```

## 4 Informative Annex A – URL schemes for IIOp addresses

Section 3.6 of OMG Naming Service specifications [OMGnam] and section 13.6 of OMG ORB Interoperability Architecture [OMGint] describe the Uniform Resource Locator (URL) schemes available to represent a CORBA object or a CORBA object bound in a Naming Service and that can be used within FIPA to represent valid IIOp addresses:

- *IOR* - The string form of an IOR (**IOR:<hex\_octets>**) is a valid URL. The scheme name is **IOR** and the text after the ':' is defined in the CORBA 2.3 specification, Section 13.6.6. The IOR URL is robust and insulates the client from the encapsulated transport information and object key used to reference the object. This URL format is independent of Naming Service.
- *corbaloc* - It is difficult for humans to exchange IORs through non-electronic means because of their length and the text encoding of binary information. The corbaloc URL scheme provides URLs that are familiar to people and similar to ftp or http URLs. The corbaloc URL is described in the CORBA 2.3 Specification, Section 13.6.6. This URL format is independent of the Naming Service.
- *corbaname* - A corbaname URL is similar to a corbaloc URL. However a corbaname URL also contains a stringified name that identifies a binding in a naming context.

Refer to the OMG specs for how to use a CORBA Naming Resolution Service and for the complete syntax of the used URL schemes.

260 **5 Informative Annex B — ChangeLog**

261 **5.1 2002/07/26 - version F by FIPA Architecture Board**

262 **Page 3, line 149 :**       **Removed strings type definition**

263 **Page 4, line 210:**       **Removed encrypted field**

264 **Page 6 :**               **Added Informative Annex A**

265
